

Reclaim Security: Redefining Enterprise Threat Exposure Management

As enterprises grapple with an ever-expanding attack surface and overwhelming volumes of security findings, one truth has become undeniable: detection alone does not reduce risk. Reclaim Security, winner of the Global 100 – 2026 award for Enterprise Threat Exposure Management Innovator of the Year, has emerged as a category-defining force by enabling organizations to finally close the gap between knowing their exposures and fixing them safely, continuously, and at scale.

Founded by seasoned security practitioners and engineers, Reclaim Security emerged from stealth in 2025 with a mission to advance the industry beyond traditional detection and prioritization. Its AI-powered platform integrates seamlessly with an organization's existing security stack, identifies critical misconfigurations and exposure gaps, and autonomously remediates them using business-aware intelligence. Headquartered in Israel, one of the world's cybersecurity innovation hubs, Reclaim now serves enterprises across industries including financial services, energy, and critical infrastructure.

At the core of the platform is its proprietary PIPE™ (Product Impact Prediction Engine), a breakthrough technology that simulates the operational impact of every potential remediation action before execution. This capability directly addresses one of the biggest barriers to remediation: fear of disrupting business operations. By validating each change in advance, PIPE™ enables safe, automated remediation while bringing essential business context into every decision. The result is faster, more reliable risk reduction and significantly improved ROI on existing security investments.

Reclaim's impact is already measurable. Following its 2025 launch, early enterprise customers experienced transformational outcomes. Telit Cinterion, a global IoT and edge connectivity leader, achieved an 80% reduction in potential ransomware attack scenarios and a 90% reduction in manual remediation tasks — all achieved with zero business disruption. Reclaim's availability on AWS Marketplace further accelerates adoption, allowing enterprises worldwide to deploy the platform rapidly and integrate it into their environments with minimal friction.

What sets Reclaim apart in the Continuous Threat Exposure Management (CTEM) landscape is its insistence that remediation — not prioritization — is the true measure of security effectiveness. Security teams remain overburdened by mounting security debt, alert fatigue, and manual processes. Reclaim eliminates these roadblocks by autonomously resolving exposures across endpoint, identity, cloud, and email layers, reducing risk at the speed attackers operate. With its approach, organizations can shift from reactive management to proactive risk elimination.

Reclaim's audience spans CISOs, VPs of Security, Security Engineering leaders, SOC teams, and IT stakeholders who need a safer, smarter way to eliminate exposures without sacrificing productivity. For them, Reclaim is more than a tool — it is a partner in building long-term resilience. Through offerings like the Reclaim Security Platform, the PIPE™ engine, and a free Threat Exposure Assessment, enterprises gain visibility into both their current exposure landscape and the demonstrable value Reclaim can deliver.
